

# Hospital Bed Styles

You may be wondering the exact differences of these hospital bed styles. There is a large difference in manual, semi-electric and full electric beds. There is also a large difference of price, so you want to know exactly what you're getting. You will notice each image only slightly changes which has to do with the number of cranks that are needed operate.

## Manual Frames

All functions performed on a manual bed are done completely by hand crank. It does take some strength to operate. This style of bed works well for people who do not need their bed position changed often and caretakers or users that are able to operate the cranks.

## Semi-Electric Frames

Semi-electric beds are a good step up from manual. Instead of having to crank 2 positions you now only have to use the hand crank to adjust the head of the bed.

## Full Electric Frames

Full electric beds are the easiest method. This is for caretakers or users who do not have enough strength or are tired of using hand cranks. Being realistic, full electric beds are the most convenient but they cost more. They can be unnecessary for some users and lifesavers for others.
